

89. Gray Code

An **n-bit gray code sequence** is a sequence of 2^n integers where:

- Every integer is in the **inclusive** range $[0, 2^n - 1]$,
- The first integer is 0 ,
- An integer appears **no more than once** in the sequence,
- The binary representation of every pair of **adjacent** integers differs by **exactly one bit**, and
- The binary representation of the **first** and **last** integers differs by **exactly one bit**.

Given an integer n , return *any valid n-bit gray code sequence*.

Example 1:

Input: $n = 2$

Output: $[0, 1, 3, 2]$

Explanation:

The binary representation of $[0, 1, 3, 2]$ is $[00, 01, 11, 10]$.

- 00 and 01 differ by one bit
- 01 and 11 differ by one bit
- 11 and 10 differ by one bit
- 10 and 00 differ by one bit

$[0, 2, 3, 1]$ is also a valid gray code sequence, whose binary representation is $[00, 10, 11, 01]$.

- 00 and 10 differ by one bit
- 10 and 11 differ by one bit
- 11 and 01 differ by one bit
- 01 and 00 differ by one bit

Example 2:

Input: $n = 1$

Output: $[0, 1]$

```
class Solution:
    def grayCode(self, n: int) -> List[int]:
        if n==1:
            return [0,1]
        if n==2:
            return [0,1,3,2]
```

```
base = [0,1,3,2]
for i in range(3,n+1):
    multiplier = pow(2,i-1)
    temp = []
    for ele in base:
        temp.append(ele+multiplier)
    base = base+temp[::-1]
    # print(temp)
return base
```
